

Drone Integration Platform version 1.1

DroneSoft is a software company focused on solutions for the global drone industry. Our vision is to enable seamless integration of drones and drone devices into enterprise applications based on our device agnostic drone integration platform. Our solutions are developed through field trials, including commercial and public sector drone scenarios and support a wide range of transponder, tracking and passive registration and data distribution systems.

The DroneSoft platform is based on a SiteCore™ and SQL enterprise backend architecture. We use high-level end-to-end encryption and two-part authentication to secure our clients valuable data. The centralized administration suite is operated based on optional cloud- and/or on premise installation. Our user-friendly web interface and iOS/Android compatible application ensures our client can focus on their core operations and benefit from all available data.

The DroneSoft platform can be white labelled for own client integration into end-user systems or delivered turnkey according to client requirements. In-house we possess the skills to customize to specific front- and backend solutions.

The DroneSoft platform allows our clients:

- To automatically collect, store and analyze drone generated data.
- To easily present data and create value through insight into operations.
- To scale use of drones to enterprise level and harvest the inherent benefits of IoT.
- To seamlessly integrate drones with other core business systems and 3rd party applications.
